

Template Project Copy for SAP Cloud ALM

Build one best-practice SAP Cloud ALM project — and roll it out across every tenant.

Built on SAP BTP · Works with SAP Cloud ALM

Overview

Template Project Copy lets implementation teams standardize how they run SAP Cloud ALM. Build a best-practice project once, then copy it into any number of SAP Cloud ALM tenants — replicating the full project structure in a single, controlled run, with a preview before anything changes.

Key capabilities

- One-run copy of the full project structure
- Timeboxes (milestone dates), teams, and deliverables
- Tasks and subtasks, with parent/child relationships preserved
- Solution-process scopes and process assignments
- Dry-run preview before any change is made
- Create new projects or update existing ones to keep targets in sync
- Secure OAuth 2.0 authentication per tenant
- Clear result log: created, updated, skipped, blocked, failed

How it works

1. Connect a source and one or more target tenants using OAuth 2.0. 2. Select the source project and choose exactly what to copy. 3. Preview with a dry run, then run sync and review the result log.

Who it's for

SAP partners and system integrators delivering repeatable, standardized implementations across clients — and enterprises keeping multiple SAP Cloud ALM tenants aligned to one methodology.

Solution architecture

Template Project Copy for SAP Cloud ALM

Solution architecture — built on SAP Business Technology Platform, integrated with SAP Cloud ALM public APIs

Built on SAP BTP; integrated with SAP Cloud ALM via the Projects, Tasks, and Process Management APIs.
